

Security Assessment

Workspace Program

August 24, 2026

Overview

Project Summary

Project Name	Workspace Program
Language	Rust (Anchor Framework)

Audit Summary

Delivery Date	August 24, 2026 UTC
Audit Methodology	Static Analysis, Manual Review

Vulnerability Summary

Vulnerability Level	Total
Critical	0
Major	0
Medium	0
Minor	1

Findings

Finding-01 : Empty Source Code File Provided

Findings

1 Total Issues

Title	Category	Severity
Empty Source Code File Provided	Implementation	Minor

Empty Source Code File Provided

Category	Implementation
Severity	Minor

Description

The provided source file for the Solana program was completely empty. A valid Anchor program requires, at a minimum, the declaration of a program ID, the program module using the appropriate macros, and definitions for instruction contexts.

Because there is no code logic present, the smart contract is functionally incomplete and cannot be compiled, deployed, or interacted with on the Solana blockchain. Subsequently, no logical flaws, arithmetic bugs, or access control vulnerabilities could be evaluated.

Recommendation

It is recommended to:

1. Implement the intended business logic of the smart contract using the Anchor framework.
2. Ensure the inclusion of necessary program macros, secure instruction contexts, and proper state account definitions.
3. Resubmit the fully implemented source code for a comprehensive security assessment before proceeding to testnet or mainnet deployment.

Summary

This report summarizes the security assessment of the Workspace Program Solana Program written in Rust using the Anchor framework. The assessment involved a comprehensive examination of the provided source code using Static Analysis and Manual Review techniques.

The audit normally focuses on identifying potential vulnerabilities, logical flaws, and adherence to Solana and Anchor best practices, including:

- Account validation and access control.
- Handling of token transfers and CPI calls.
- Arithmetic operations to prevent overflows/underflows.
- State management and data integrity.

During this specific assessment, it was discovered that the provided source code file was entirely empty. Consequently, zero critical, major, or medium severity vulnerabilities were identified, as there is no executable logic or state management present that could be exploited.

A single Minor/Informational finding was recorded to document the missing implementation. Once the program logic is developed and integrated, a subsequent end-to-end security audit
